

# FINAL USER STUDY

Group I I

70119 - André Rodrigues

81633 - João Henriques

94060 - Luís Loureiro

# USER STUDY

- 15 tests
- Quantitative Results with help of Think-Aloud method

## USER TESTS

**1st)** We gave an introduction to the users for them to know what the project is about and what they will be doing and did a pre-questionnaire before any test.

**2nd)** We gave them a task: We'd like you to go and try to catch the metro and tell us everything you do while using this prototype.

- If the user doesn't buy the ticket, after he reaches the metro: Go back and grab a ticket from the ticket machine and catch the metro again.

**3rd)** Repeat the same as before but this time:

- How many screens can you identify?
- Can you identify who has a valid or invalid ticket? How many people from each?

# DESCRIBING THE PARTICIPANTS

Genre

Age

How often do you use the metro

How often do you validate your ticket

Have you already used Virtual Reality

How would you feel if you knew you were being monitored with cameras to make sure you validate your ticket

# ANALYSIS OF RESULTS

# TASK I

Asked what was the noise heard

Noticed the screens

Noticed someone with a valid or invalid ticket

## TASK 2

Correct answer

How many people has a invalid ticket

Correct answer

How many people has a valid ticket

Correct answer

# IMPLICATIONS FOR FURTHER REFINEMENTS

## Improvements for our solution:

Add alternatives to beep sound when people doesn't validate their ticket.

Remove monitors that aren't being seen.

## Improvements for our prototype:

Users around the metro should be different so can be easier to distinguish.

Add people always entering and exiting the station.

Easily reset scene
